This weeks problem set focuses on the ideas of linear combinations, linear dependence and bases. A question marked with a \dagger is difficult and probably too hard for an exam (though still illustrates a useful point). A question marked with a * is especially important.

Homework: due Friday 18 Jan: questions 3 and 4 below.

- 1. From section 1.4, problems 1, 7, 8 ($P_n(F)$ is the set of polynomials of degree less than or equal to n), 11, 12, 13*.
- 2. From section 1.5, problems 1, 2a, c, e, 4*, 5, 9*, 15, 18*.
- 3.* Let V be a vector space over a field \mathbb{F} and W a subspace of V. For any $v \in V$, consider the set $\{v\} + W = \{v + w \mid w \in W\}$. We will denote it simply as v + W. Now consider the set

$$V/W = \{v + W | v \in V\}.$$

We can define addition and scalar multiplication on this set by

$$(v+W)+(w+W)=(v+w)+W$$
 and $\lambda(v+W)=\lambda v+W$.

Prove that V/W is a vector space. It is called the *quotient* of V by W.

- 4. Let $\mathbb{C}[x]$ be the vector space of polynomials and let $W = \text{span}\{x^a \mid a > 2\}$.
 - (a) Find a set of 3 linearly independent elements of $\mathbb{C}[x]/W$.
 - (b) Find 2 nonzero elements $p, q \in \mathbb{C}[x]$ that are linearly independent and such that p+W and q+W are linearly dependent and nonzero. Note: you can only receive full points for this problem if your polynomials p and q and different from everyone elses! If you understand the problem then this will be easy to ensure. Please write your two polynomials very large on the top of your homework.

Note on problem 3: The astute reader might be worried that the addition and scalar multiplication might not be well defined. What do I mean by this? Well, it is entirely possible that v + W = v' + W for two different elements $v, v' \in V$. This means we could calculate a sum in two different ways. As

$$(v + W) + (u + W) = (v + u) + W$$

or as

$$(v + W) + (u + W) = (v' + W) + (u + W) = (v' + u) + W$$

(since v + W = v' + W). So we need to check that (v + u) + W = (v' + u) + W. I will show you how to do this below. You might like to try to prove that the scalar multiplication is unambiguous for yourself.

Proof that (v + u) + W = (v' + u) + W: Note that $(v + u) + W = \{(v + u) + w \mid w \in W\}$ and $(v' + u) + W = \{(v' + u) + w \mid w \in W\}$. Also note that $v \in v + W$ since v = v + 0 and $0 \in W$.

Since v + W = v' + W we see that $v \in v' + W$ and thus v = v' + x for some $x \in W$. Now lets take an arbitrary elements $s \in (v + u) + W$, it will be of the form s = v + u + w. We know

$$s = v + u + w = v' + x + u + w = (v' + u) + (x + w).$$

Since $x + u \in W$ we see that $s = (v' + u) + (x + w) \in (v' + u) + W$. We have just shown that $(v + u) + W \subset (v' + u) + W$. To complete the proof we need to show the opposite containment.

We do this in almost the same way. Take an arbitrary element $t \in (v'+u)+W$. We have that t=v'+u+w for some $w \in W$. Then

$$t = v' + u + w = v - x + u + w = (v + u) + (w - x) \in (v + u) + W.$$

Thus we have shown $(v'+u)+W\subset (v+u)+W$ and hence (v+u)+W=(v'+u)+W.
