This weeks problem set focuses on the concept of a change of basis matrix. A question marked with a  $^{\dagger}$  is difficult and probably too hard for an exam (though still illustrates a useful point). A question marked with a  $^*$  is especially important.

Homework 3: due Friday 14 February: questions 2 and 5 below.

- 1. From section 2.5, problems 1, 2a, c, 3a, c, 5, 7,  $10^*$ ,  $13^*$ .
- 2.\* Let V be a finite dimensional vector space and W a subspace. Show that V and  $W \times V/W$  are isomorphic by finding an explicit isomorphism (rather than simply computing the dimensions).
- 3\* Let V be a finite dimensional vector space and W a subspace. Show that  $\dim(V/W) = \dim V \dim W$ . Hint: consider a basis of W and extend it to V. Now find a basis for V/W. You can also prove it using the dimension theorem.
- $4^*$  Let  $T:V\longrightarrow W$  be a linear map.
  - (a) Show that im T and  $V/\ker T$  are isomorphic.
  - (b) Use this (and the previous exercise) to give an alternative proof of the dimension theorem.
- 5. A differential operator on  $\mathbb{R}_n[x]$  is a linear combination of expressions of the form  $x^a \frac{d^b}{dx^b}$  where  $a b \leq 0$  (otherwise the degree would potentially increase!). We can consider a differential operator as a linear map  $\mathbb{R}_n[x] \longrightarrow \mathbb{R}_n[x]$ .
  - (a) Let  $D: \mathbb{R}_2[x] \longrightarrow \mathbb{R}_2[x]$  be the differential operator given by  $2-4\frac{d}{dx}+2x^2\frac{d^2}{dx^2}$ . Find the matrix of D relative to the basis  $\{x^2, (x-1)^2, (x+1)^2\}$ . Note: the 2 in D mean multiply by 2, so D(1)=2 and D(x)=2x-4.
  - (b) Suppose  $E: \mathbb{R}_2[x] \longrightarrow \mathbb{R}_2[x]$  is a differential operator and that the matrix of E, relative to the basis  $\{1, x, x^2\}$  is

$$\begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 4 \\ 0 & 0 & 0 \end{pmatrix}.$$

Find E.
