# **Antiderivatives**

We will be concentrating on solving differential equations of the form

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

# **Antiderivatives**

We will be concentrating on solving differential equations of the form

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

A solution y = F(x) is called an antiderivative of f(x).

### Question

What is the antiderivative of f(x) = 2x?

## Question

What is the antiderivative of f(x) = 2x?

$$F(x) = x^2$$

## Question

What is the antiderivative of f(x) = 2x?

$$F(x) = x^2 + 4$$

## Question

What is the antiderivative of f(x) = 2x?

$$F(x) = x^2 + 8$$

## Question

What is the antiderivative of f(x) = 2x?

$$F(x) = x^2 + C$$

### Question

What is the antiderivative of  $f(x) = x^3 + 4x - 1$ ?

# Question

What is the antiderivative of  $f(x) = x^3 + 4x - 1$ ?

$$F(x) = \frac{1}{4}x^4$$

### Question

What is the antiderivative of  $f(x) = x^3 + 4x - 1$ ?

$$F(x) = \frac{1}{4}x^4 + 2x^2$$

## Question

What is the antiderivative of  $f(x) = x^3 + 4x - 1$ ?

$$F(x) = \frac{1}{4}x^4 + 2x^2 - x$$

### Question

What is the antiderivative of  $f(x) = x^3 + 4x - 1$ ?

$$F(x) = \frac{1}{4}x^4 + 2x^2 - x + C$$

## Question

What is the antiderivative of  $f(x) = e^{2x}$ ?

## Question

What is the antiderivative of  $f(x) = e^{2x}$ ?

$$F(x) = e^{2x}$$

## Question

What is the antiderivative of  $f(x) = e^{2x}$ ?

$$F(x) = \frac{1}{2}e^{2x}$$

### Question

What is the antiderivative of  $f(x) = \frac{1}{x}$  (for x > 0)?

## Question

What is the antiderivative of  $f(x) = \frac{1}{x}$  (for x > 0)?

$$F(x) = \ln x$$

# Question

What is the antiderivative of  $f(x) = \frac{1}{(1+x)^2}$ ?

# Question

What is the antiderivative of  $f(x) = \frac{1}{(1+x)^2}$ ?

## Solution

Note that  $f(x) = (1 + x)^{-2}$ . So

$$F(x) = \frac{1}{1+x}$$

# Question

What is the antiderivative of  $f(x) = \frac{1}{(1+x)^2}$ ?

# Solution

Note that  $f(x) = (1 + x)^{-2}$ . So

$$F(x) = -\frac{1}{1+x}$$

### Question

What is the antiderivative of  $f(x) = 2x \cos x^2$ ?

### Question

What is the antiderivative of  $f(x) = 2x \cos x^2$ ?

$$F(x) = \sin x^2$$

### Question

What is the antiderivative of  $f(x) = \frac{1}{\sqrt{x}}$ ?

### Question

What is the antiderivative of  $f(x) = \frac{1}{\sqrt{x}}$ ?

$$f(x) = x^{-\frac{1}{2}}$$

### Question

What is the antiderivative of  $f(x) = \frac{1}{\sqrt{x}}$ ?

$$f(x) = x^{-\frac{1}{2}}$$

### Question

What is the antiderivative of  $f(x) = \frac{1}{\sqrt{x}}$ ?

$$f(x) = x^{-\frac{1}{2}}$$

$$F(x) = x^{\frac{1}{2}}$$

### Question

What is the antiderivative of  $f(x) = \frac{1}{\sqrt{x}}$ ?

$$f(x) = x^{-\frac{1}{2}}$$

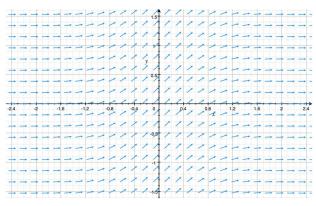

$$F(x)=2x^{\frac{1}{2}}$$

## Slope fields

In some cases it is impossible to find the antiderivative (without special functions). E.g.  $\,$ 

$$f(x) = e^{-x^2}$$

But we can still (approximately) graph the antiderivative! First we draw the slope field

How to draw a slope field for

$$\frac{\mathrm{d}y}{\mathrm{d}x}=f(x)$$

1. Draw the xy-plane.

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

- 1. Draw the xy-plane.
- 2. At every point (x, y) what would the slope of y = F(x) be if it passed through that point?

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

- 1. Draw the xy-plane.
- 2. At every point (x, y) what would the slope of y = F(x) be if it passed through that point?
- 3. Answer given by differential equation above, slope is f(x)

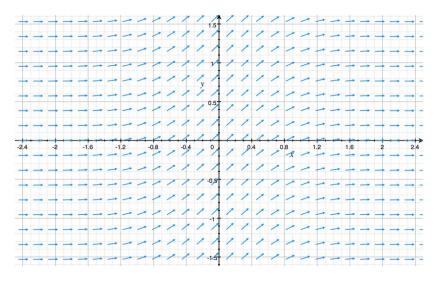

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

- 1. Draw the xy-plane.
- 2. At every point (x, y) what would the slope of y = F(x) be if it passed through that point?
- 3. Answer given by differential equation above, slope is f(x)
- 4. Draw a small arrow with slope f(x) and the point (x, y)

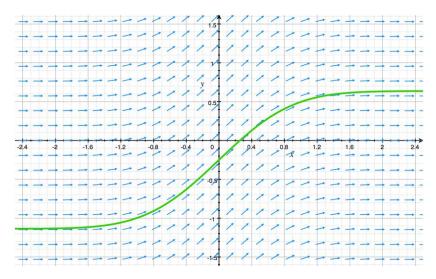

$$\frac{\mathrm{d}y}{\mathrm{d}x} = f(x)$$

- 1. Draw the xy-plane.
- 2. At every point (x, y) what would the slope of y = F(x) be if it passed through that point?
- 3. Answer given by differential equation above, slope is f(x)
- 4. Draw a small arrow with slope f(x) and the point (x, y)
- 5. Do this for a grid of points on the xy-plane.

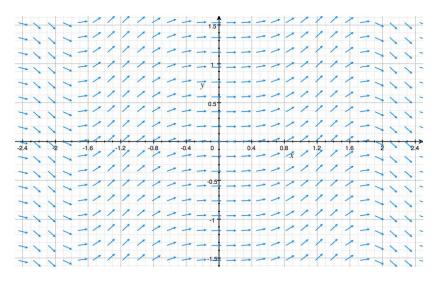

$$f(x) = e^{-x^2}$$
 with  $F(0) = -0.25$ 

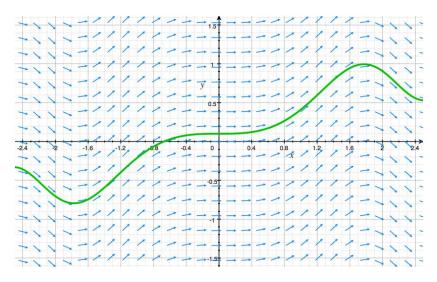

$$f(x) = e^{-x^2}$$
 with  $F(0) = -0.25$ 

$$f(x) = \sin(x^2)$$
 with  $F(0) = 0.1$ 

$$f(x) = \sin(x^2)$$
 with  $F(0) = 0.1$ 

Often we enconter problems involving accumulated change.

Often we enconter problems involving accumulated change.

### Example

A rocket is accelerating at a rate of  $a(t) = 0.3t^2$  metres per second squared. What is the rockets velocity at t = 30?

Often we enconter problems involving accumulated change.

### Example

A rocket is accelerating at a rate of  $a(t) = 0.3t^2$  metres per second squared. What is the rockets velocity at t = 30?

### Example

A population grows at a rate of 0.5P(t) people per year. How much does the population increase over 10 years?

Often we enconter problems involving accumulated change.

### Example

A rocket is accelerating at a rate of  $a(t) = 0.3t^2$  metres per second squared. What is the rockets velocity at t = 30?

### Example

A population grows at a rate of 0.5P(t) people per year. How much does the population increase over 10 years?

Often we enconter problems involving accumulated change.

### Example

A rocket is accelerating at a rate of  $a(t) = 0.3t^2$  metres per second squared. What is the rockets velocity at t = 30?

### Example

A population grows at a rate of 0.5P(t) people per year. How much does the population increase over 10 years?

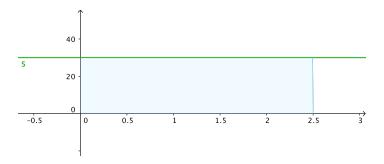

These problems involve finding the area under some curve.

If a car travels at a constand speed of 30 miles per hour, how much distance does it cover after 2.5 hours?

If a car travels at a constand speed of 30 miles per hour, how much distance does it cover after 2.5 hours?

#### Solution

We model the car's speed using the function s(t) = 30. So we can see that the area under this curve

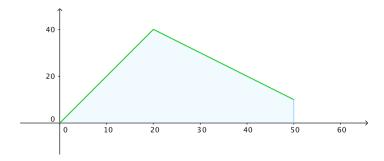

is the distance travelled (75 miles)

If a car accellerates for 20 seconds at a rate of  $2m/s^2$  and then decelerates for 30 seconds at a rate of  $1m/s^2$ , how far has it travelled?

If a car accellerates for 20 seconds at a rate of  $2m/s^2$  and then decelerates for 30 seconds at a rate of  $1m/s^2$ , how far has it travelled?

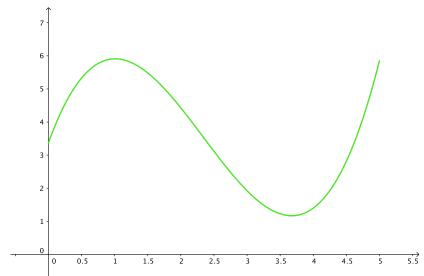

#### Solution

The car's speed is given by s(t)=2t when  $0 \le t \le 20$  and s(t)=60-t when  $20 \le t \le 50$ . So the graph looks like

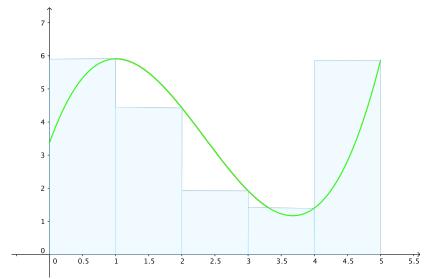

# More complicated rates of change

Suppose we have a car whose speed is descibed by the following curve. How far has it travelled in this time?

# More complicated rates of change

Suppose we have a car whose speed is descibed by the following curve. How far has it travelled in this time?

• Suppose we know the rate of change f(t), of some quantity (distance, water flow, population, etc).

- Suppose we know the rate of change f(t), of some quantity (distance, water flow, population, etc).
- How do we find the total amount by which this changes between t = a and t = b?

- Suppose we know the rate of change f(t), of some quantity (distance, water flow, population, etc).
- How do we find the total amount by which this changes between t = a and t = b?
- Answer: area under f(t) between a and b.

## Areas under general curves

We would like to calculate the area between a function f(x) and the x-axis, between x = a and x = b.

## Areas under general curves

We would like to calculate the area between a function f(x) and the x-axis, between x = a and x = b.

A first approach to calculating the area under a curve is to approximate using rectangles:

### Areas under general curves

We would like to calculate the area between a function f(x) and the x-axis, between x = a and x = b.

A first approach to calculating the area under a curve is to approximate using rectangles:

(Too hard to draw, lets look at an animation)

# The definite integral

#### **Defintion**

The definite integral of a function f(x) is defined to be

$$\int_{a}^{b} f(x) dx = \lim_{n \to \infty} \Delta x \sum_{k=1}^{n} f(a + k \Delta x)$$

where  $\Delta x = \frac{b-a}{n}$ .

### Theorem

$$\frac{\mathrm{d}}{\mathrm{d}x} \int_{a}^{x} f(t) \, \mathrm{d}t = f(x)$$

### Theorem

$$\frac{\mathrm{d}}{\mathrm{d}x} \int_{a}^{x} f(t) \, \mathrm{d}t = f(x)$$

#### Theorem

$$\frac{\mathrm{d}}{\mathrm{d}x} \int_{2}^{x} f(t) \, \mathrm{d}t = f(x)$$

That is,  $F(x) = \int_a^x f(t) dt$  is an antiderivative of f(x)!

#### Note

#### Theorem

$$\frac{\mathrm{d}}{\mathrm{d}x} \int_{2}^{x} f(t) \, \mathrm{d}t = f(x)$$

That is,  $F(x) = \int_a^x f(t) dt$  is an antiderivative of f(x)!

#### Note

•  $F(x) = \int_a^x f(t) dt$  is a function of x.

#### Theorem

$$\frac{\mathrm{d}}{\mathrm{d}x} \int_{a}^{x} f(t) \, \mathrm{d}t = f(x)$$

That is,  $F(x) = \int_a^x f(t) dt$  is an antiderivative of f(x)!

#### Note

- $F(x) = \int_a^x f(t) dt$  is a function of x.
- every input x produces a number as an output.

# A consequence (corrollary)

### Corollary

For any antiderivative F(x) of f(x)

$$\int_a^b f(x) \, \mathrm{d}x = F(b) - F(a)$$

# A consequence (corrollary)

### Corollary

For any antiderivative F(x) of f(x)

$$\int_a^b f(x) \, \mathrm{d}x = F(b) - F(a)$$

### Why?

Well  $F(x) = \int_a^x f(t) dt + C$  for some a and C. So

$$F(b) - F(a) = \int_a^b f(t) dt + C - \int_a^a f(t) dt - C$$
$$= \int_a^b f(t) dt$$

### Question

Evaluate the definite integral

$$\int_0^1 x^2 - 4 \, \mathrm{d}x$$

#### Question

Evaluate the definite integral

$$\int_0^1 x^2 - 4 \, \mathrm{d}x$$

#### Solution

An antiderivative of  $x^2 - 4$  is  $\frac{1}{3}x^3 - 4x$  so

$$\int_0^1 x^2 - 4 \, dx = \frac{1}{3} \cdot 1^3 - 4 - \frac{1}{3} \cdot 0^3 + 4 \cdot 0$$
$$= \frac{1}{3} - 4 = -\frac{11}{3}$$

### Question

Evaluate the definite integral

$$\int_0^\pi \sin x \, \mathrm{d}x$$

#### Question

Evaluate the definite integral

$$\int_0^\pi \sin x \, \mathrm{d}x$$

#### Solution

An antiderivative of  $\sin x$  is  $-\cos x$  so

$$\int_0^{\pi} \sin x \, dx = -\cos \pi + \cos 0$$
$$= -(-1) + 1 = 2$$
