This weeks problem set focuses on the ideas of linear combinations, linear dependence and bases. A question marked with a \dagger is difficult and probably too hard for an exam (though still illustrates a useful point). A question marked with a * is especially important.

Homework: due Friday 10 April, uploaded to Gradescope before 11:59pm: questions 3,4, and 5 below.

- 1. From section 1.4, problems 1, 7, 8 ($P_n(F)$ is the set of polynomials of degree less than or equal to n), 11, 12, 13*.
- 2. From section 1.5, problems 1, $2a, c, e, 4^*, 5, 9^*, 15, 18^*$.

Quotient spaces: Let V be a vector space over a field \mathbb{F} and W a subspace of V. For any $v \in V$, consider the set $\{v\} + W = \{v + w \mid w \in W\}$. We will denote it simply as V + W. Now consider the set

$$V/W = \{v + W|\ v \in V\}.$$

We can define addition and scalar multiplication on this set by

$$(v+W)+(w+W)=(v+w)+W$$
 and $\lambda(v+W)=\lambda v+W$.

It turns out this is a vector space, it is called the *quotient* of V by W. See below.

- 3. Let $V = \mathbb{R}^2$ and $W = \text{span } \left\{ \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right\}$. List all the elements of V/W, making sure not to list any element twice.
- 4.* Prove that V/W is a vector space.
- 5. Let $\mathbb{C}[x]$ be the vector space of polynomials and let $W = \operatorname{span}\{x^{2a} \mid a \geq 0\}$.
 - (a) Find a set of 3 linearly independent elements of $\mathbb{C}[x]/W$.
 - (b) Find 2 nonzero elements $p, q \in \mathbb{C}[x]$ that are linearly independent and such that p+W and q+W are linearly dependent and nonzero. Note: you can only receive full points for this problem if your polynomials p and q and different from everyone elses! If you understand the problem then this will be easy to ensure.

Note on quotient spaces: The astute reader might be worried that the addition and scalar multiplication might not be well defined. What do I mean by this? Well, it is entirely possible that v + W = v' + W for two different elements $v, v' \in V$. This means we could calculate a sum in two different ways. As

$$(v + W) + (u + W) = (v + u) + W$$

or as

$$(v+W) + (u+W) = (v'+W) + (u+W) = (v'+u) + W$$

(since v + W = v' + W). So we need to check that (v + u) + W = (v' + u) + W. I will show you how to do this below. You might like to try to prove that the scalar multiplication is unambiguous for yourself.

Proof that (v + u) + W = (v' + u) + W: Note that $(v + u) + W = \{(v + u) + w \mid w \in W\}$ and $(v' + u) + W = \{(v' + u) + w \mid w \in W\}$. Also note that $v \in v + W$ since v = v + 0 and $0 \in W$.

Since v + W = v' + W we see that $v \in v' + W$ and thus v = v' + x for some $x \in W$. Now lets take an arbitrary elements $s \in (v + u) + W$, it will be of the form s = v + u + w. We know

$$s = v + u + w = v' + x + u + w = (v' + u) + (x + w).$$

Since $x + u \in W$ we see that $s = (v' + u) + (x + w) \in (v' + u) + W$. We have just shown that $(v + u) + W \subset (v' + u) + W$. To complete the proof we need to show the opposite containment.

We do this in almost the same way. Take an arbitrary element $t \in (v'+u)+W$. We have that t=v'+u+w for some $w \in W$. Then

$$t = v' + u + w = v - x + u + w = (v + u) + (w - x) \in (v + u) + W.$$

Thus we have shown $(v'+u)+W\subset (v+u)+W$ and hence (v+u)+W=(v'+u)+W.
